C;Comment: The term tropoelastin refers to a soluble precursor form of the extracellular
ine oxidase activity.

Namuelar 181502-2; Sequence=VSP 004243; Isolate 195502-2; Sequence=VSP 004243; Isolate 195502-2; Sequence=VSP 004243; Isolate 1958ASE: Defects in ELNA are a cause of autosomal dominant cutis laxa [MIM:123700] Cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased characterized by loose, hyperextensible skin with decreased resilience and elasticity leadaing to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric stenosis.

--- DISEASE: Haploinsufficiency of ELN may be the cause of certain cardiovascular and musculo-skeletal abnormalities observed in Williams-Beuren syndrome (WBS) [MIM:194050]. WBS is a rare developmental disorder and a contiguous gene deletion syndrome involving genes from chromosome band 7g11.23 aleletion syndrome stenosis (SvAS) [MIM:185500]. SvAS is a congenital narrowing of the ascending aorta which can occur sporadically, as an autosomal dominant condition, or as one component of Williams-Beuren

Figolated supravalvular actric stenosis: functional haploinsufficiency
of the elastin gene as a result of nonsense-mediated decay.";
Hum. Genet. 106:577-58812000).
I-FUNCIION: Major structural protein of tissues such as aorta and
nuchal ligament, which must expand rapidly and recover completely.
SUBUNIT: The polymeric elastin chains are cross-linked together
inc an extensible 3D network.
I-SUBCELIOUAR LOCATION: Extracellular matrix of elastic fibers.

                                             --- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.
--- SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.
--- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
--- PTM: The crosslinks are made of deaminated Lys.

-!- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completel-
-!- SUBMUNT: The polymeric elastin chains are cross-linked together into an extensible 3D network.
                                                                    SEQUENCE FROM N.A., AND ALTERNATIVE SPLICING.

```
The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated to so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility, to proteolysis is increased. The derivatives have with reduced susceptibility, and can be cased where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative-competitive inhibition of protease activity. The tropoelastin derivative-competition in the protease activity of a medicine, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents medicine, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents of miducing chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit
                                                                                                                                                                                                                                                                                                                                       Tropoelastin; derivative; proteolysis; protease; antiwrinkle;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        90 IPGGVVCAGPAAAAAAAXAAAKAAQFGLVGAAGLGGLGVGGGCGVGGLGGIPPAAAK 149
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAO)-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are useful produce the proteins recombinantly. The tropoelastin derivatives nor hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAO-binding properties, products. The hybrid protein have controllable GAO-binding properties, peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELDgamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09

The present sequence represents a human tropoelastin splice form. The specification describes tropoelastin derivatives, in which a subsequence consistent of the subsequence of the subsequence has been inserted so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be castagraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease of civity. The tropoelastin derivatives, and other polypeptides containing tropoelastin derivative-derived protease-susceptibility sites, are useful for numan or veterinary medicine, cosmetics (e.g. antiwrinkle or hand contropoelastin derivative dorinding chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth cuscle cells, epithelial or endothelial cells, fibroblasts, osteocytes, conditoroytes and platelets. Peptidomimetics that mimic the protease conditions are used for protecting against lung damage caused by the protease, and are used for protecting against lung damage caused by metastases, or to limit protease activity that causes blood clotting
                                                                                                                                                                             Tropoelastin; derivative; proteolysis; protease; antiwrinkle; hand lotion; bulking agent; chemotaxis; proliferation; growth inhibition; peptidomimetic; lung damage; elastin; cancer; metastasis; blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  561 GVRRSLSPELREGDPSSSQHLPSTPSSPRVPGALAAKAAKYGAAVPGVLGGLGALGGVG 620

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins contening the derivatives are useful in medical, wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated tropoelastin derivative SHED26-36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IPGGVVGAGPAAAAAAAAAAAAAGFGLVGAAGLGGLGVGGLGVPGVGGLGGIPPAAAAK 120

Human elastin mature protein.
      25-JUN-2003 (first entry)
ô
                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a minimal functional unit (MFU) of human elastin polypeptide. This protein is useful in a cosmetic material or a prosthetic material such as prosthesis for blood vessel replacements, for heart valve replacement, tissue replacement, for covering burns, for covering wounds and stents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          621 IPGGVVGAGPAAAAAAAAAAAAAAAAGFGLVGAAGLGGLGVGGLGVPGVGGLGGLPPAAAAK 680
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GVRRSLSPBLREGDPSSSQHLPSTPSSPRVPGALAAAKAAKYGAAVPGVLGGLGALGGVG 620

The invention describes a polypeptide (I) comprising a minimal functioning unit (MFU) which is present in the sequence of human elastin and comprised of at least three beta-sheet/beta-turn structures, and at least construct one amino acid residue that participates in cross-linking, and not construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel creplacement, heart replacement valves and sheets for other uses such as burns or wounds to promote healing. MFUS can be co-aggregated with other proteins, for e.g. collagen, to provide prosthesis material that cresebles the matural structural materials of the body. MFUS modeled on lamprin and other fibrous proteins e.g. spider silk, can be used to make a variety of materials, for a number of different applications, for e.g. cortains are proteins for use in parachutes and in cosmetics. Coating synthetic prosthesis with MFUS modeled on human elastin significantly inhibits platelet binding and activation. The human-like MFU material is more biocompatible than other elastin-containing materials. In contrast corsolubilised fragments of elastin used before, an MFU is a single paractical purposes. Like other elastin preparations, the MFU is non-functionant for experimental and practical purposes. Like other elastin preparations, the MFU is non-immunogenic, thus providing a truly biocompatible material. MFUS modeled con lamprin and other fibrous proteins can be used to make a variety of materials having high tensile strength, elasticity and plasticity of materials them man are and proteins. This is the amino acid sequence of mature human companies are proteins of the invention are based

                               Polypeptide for constructing human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing, comprises three beta sheets and three beta turns.
                                                                                                                                                                fibrous protein; prosthesis; elastin; lamprin; spider silk protein;
blood vessel; wound; burn healing; collagen.

consisting at least three beta sheets/beta turns, and (d) a polypeptide consisting essentially of a spider silk protein comprising at least three beta sheets/beta turns, a polypeptide having the primary cructure of a portion of a naturally occurring fibrous protein and a secondary structures comprises from and a secondary structures comprises from 3 to about 7 amino acids and the polypeptide is not a naturally occurring throus protein. The minimal functional unit (MFU) of the invention is useful to construct human elastin-like prostheses such as tubes for blood veshel to construct human elastin-like prostheses such as tubes for blood veshel to construct human be co-aggregated with other proteins, con elaing. Alternatively the MFU can be co-aggregated with other proteins, con example collagen, to provide prosthesis material that resembles the collagen, to provide prosthesis material that resembles the subject to infiltration of cells growing in the patient, including conductual materials of the body. The MFU based material is calbacement. The material is more biocompatible than other elastin containing materials proposed for prostheses.
                                                                                                                                                                                                                                                                                                                                                           0

```

This invention describes a polypeptide that comprises three beta sheet/beta turn structures and that is not a naturally occurring fibrous protein. The invention also describes a prosthesis comprising an animal, metal or synthetic material, where the surface is coated with the polypeptide, a cosmetic material comprising the polypeptide, an elastic comprising the polypeptide, a high tensile strength material comprising the polypeptide a material comprising two or more polypeptide a material comprising two or more polypeptide comprising at least three beta sheet/beta turn structures, (b) a polypeptide consisting essentially of a structures, (b) a polypeptide consisting essentially of a portion of the amino acid sequence of an animal elastin comprising at least three beta sheets/beta turns, (c) a polypeptide consisting essentially of a portion

the invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycam (G4G))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are useful to produce the proteins recombinantly. The tropoelastin derivatives have to produce the proteins recombinantly. The tropoelastin derivatives have not hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as urgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents the amino acid sequence of the synthetic human tropoelastin SHEL

Human synthetic tropoelastin is susceptible to hydrolytic breakdown of the crosslinks. Such material may be useful in e.g. surgical applications, where the gradual loss of material over time is intended. (Updated on 25-WAR-2003 to correct PN field.)

The present invention relates to the use of an agent that promotes clastin signaling in smooth muscle cells for decreasing or preventing occlusion of a body vessel by smooth muscle cells, decreasing vascular obstruction, promoting actin stress fiber formation or actin polymentsation, increasing F:G actin ratio in a smooth muscle cells treating or preventing obstructive vascular disease (e.g. restenosis), or treating or preventing obstructive vascular disease (e.g. restenosis), or preventing stenosis. The agent that promotes elastin signaling in smooth muscle cells is useful for decreasing vascular obstruction, promoting vessel by smooth muscle cells, decreasing vascular obstruction, promoting catin ratio in a smooth muscle cell, treating or preventing obstructive actin ratio in a smooth muscle cell, treating or preventing obstructive stenosis. It is also useful in manufacturing a medicament for the treatment or prevention of cclusion of a vessel. The present sequence is treatment propoelastin protein as shown in the exemplification of the

activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic, antigout, antiinflammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease are arthritides, such as rheumatoid arthritis, lupus, amkylosing spondylitis, fibrositis, fibrositis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an immune disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from

induced arthritis, and reducing the symptoms associated with collagen-induced arthritis. The compositions of the invention have the following

induced arthritis;

and

Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia e

Disclosure; Page; 56pp; English.

(CHIL-) CHILDREN'S HOSPITAL MEDICAL CENT,

Hirsch R, Thorton SL; WPI; 2003-712740/67. GENBANK; NP 000492. The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention further comprises: a treatment of rheumatoid arthritis; identification of

genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis in a mammal; an array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collagen-

The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are useful produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, planamacutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, products. The hybrid protein have controllable GAG-binding properties, peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHEEL26-36 excluding exon 26A product

macromolecular binding properties, useful e.g. as surgical implants.

Claim 39; Page 11; 82pp; English.

New derivatives of human tropoelastin - with elastin-like or

Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical; pharmaceutical; veterinary; cosmetic application; anti-wrinkle; food; hand lotion; surgical implant; industrial product; human; SHEL; variant. putypeptitue into imas at items. Juring by the protein. Bach beta-sheet structure has cont a naturally occurring fibrous protein. Bach beta-sheet structure has 3-7 (preferably 5-7) amino acids and the MFU polypeptide may include at least 1 amino acid that can take part in crosslinking. The polypeptide can also be derived from the sequences of animal elastin, lamptin and complete same primary structure as part of a natural fibrous protein. They are used to coat prosthesse made of animal or synthetic material or metal, particularly for use as blood vessel or heart valve replacements, metal, particularly for use as blood vessel or heart valve replacements. Wound or burn dressings, or stents. They can be used in cosmettic, elastic or high-tensile strength materials, e.g. ropes or parachute cord. Or high-tensile strength materials, e.g. ropes or parachute cord. Prosthesse based on the MFU allow penetration of endothelial cells, so become permanent, living, tissue replacements. The MFU polypeptides have better blocompatibility than known elastin-based materials. They are well defined, homogeneous material and are easier to manipulate and produce than full-length elastins. They are non-thromogenic and non-immunogenic. Properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. combining the high exernsibility of elastin and the high tensile strength of spider
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               620

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated so that eusceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be contact with serum or wound exudate. The tropoelastin derivatives provide contact with serum or wound exudate. The tropoelastin derivative provide competitive inhibition of protease activity. The tropoelastin derivative-competitive inhibition of protease activity. The tropoelastin derivative-competitive inhibition of protease activity. The tropoelastin derivative-competition in the protease susceptibility sites, are useful in human or veterinary and for inducting chemotaxis. They are also useful for proliferation or competition, particularly of smooth muscle cells, epithelial or growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastasses, or to limit or protease activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       QFGLVGAAGLGGUGVGGLGVPGVGGLGGIPPAAAAKAAKYGAAGLGGVLGGAQQFPLGGV 144

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, mentidiabetic, immunosuppressive, anti-HIV, gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosolerosis, hypertension, cancer, obesity, diabetes, ADS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       665

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (64G)-binding properties. Cells containing vectors glycosaminoglycan (64G)-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents the synthetic human tropoelastin variant SHELdelta26A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    84

The present sequence represents a numan requered tropoctabelly delight-delight-delight.

C designated SHEL-delight-delight as degenered by removing exon 26a designated SHEL-delight-delight.

C of SHEL (SHEL not defined). The protein is representative of tropoclastin derivatives of the invention, in which a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be increased. The derivatives have with reduced susceptibility, e.g. in contact with serum or wound exudate. The tropoclastin derivatives provide contact with serum or wound exudate. The tropoclastin derivatives provide contact with serum or wound exudate. The tropoclastin derivative of derivatives, and other polypeptides containing tropoclastin derivative derivatives, and other polypeptides containing tropoclastin arised for derivative, and the polypeptides containing tropoclastin or derivative, comedicine, cosmetics (e.g. antiwainke or hand lotions), as bulking agents and for inducing chemotaxis. They are also useful for proliferation or conductives in the protease cleavage site in tropoclastin endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. C derivatives are competitive inhibitors of the protease cleavage site in tropoclastin cells derivatives are competitive inhibitors of the protease of the protease, and are used for controlling localized growth of cancers or metastases, or to limit controlling activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   611
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            671

```

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a parient sample and comparing this with the amount of gene product in a control sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, aldehyde dehydrogenase 6, gravin, phospholipase C epsilon, elastin, insulin-like growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor PTK7, collagen type XVIII alpha 1, platelet brind growth factor receptor alpha, laminin M chain, subtilisin like protein PACS4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human elastin

The method of the invention has sytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               85 QFGLVGAAGLGGLGVGGLGVPGVGGLGGIPPAAAKAAKYGAAGLGGVLGGAGQFPLGGV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells contending vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELIGAMMMA excluding the product encoded by exon
                                                                         Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical; pharmaceutical; veterinary; cosmetic application; anti-wrinkle; food; hand lotion; surgical implant; industrial product; human; SHEL; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a derivative or variant of human tropoelastin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   6 VPGALAAAKAAKYGAAVPGVLGGLGGLGGVGTPGGVVGAGPAAAAAAAAAAAAAAAAAAGFGLV

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical; pharmaceutical; veterinary; cosmetic application; anti-wrinkle; food; hand lotion; surgical implant; industrial product; human; SHEL.

The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated tropoelastin derivative SHELdeltamodified

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel colypeptides. Also claimed is a polypeptide enroded by the polynucleotide, an antibody binding to the polypeptide or peptide or its partial peptide, immunologically assaying the polypeptide or peptide or the polynucleotide, immunologically assaying the polypeptide or peptide or the polynucleotide by contacting the polypeptide or peptide or the polynucleotide by contacting the polynucleotide in an expressible manner and an antisense polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide and encoded for detecting the polynucleotide. The polynucleotide and encoded of proteins are useful as pharmaceutical agents and many disease-related genes may be included in their expression and activity, or as targets of genes may be included in their expression and activity, or as targets or regulation of their expression and activity, or as targets or genes therapy. The genes are involved in tissue and/or call creamscription-related proteins, signal transduction-related proteins, contents, signal transduction-related proteins, content of the activity or expression of the encoded protein to treat diseases. The content of the activity or expression of the encoded protein to treat diseases. The sequence data for this patent is not represented in the printed content of the invention. Note: Some of the supplied by the content of the invention of the invention of the invention of the content of the invention of the content of the invention of

AAB08630

20-DEC-2000 (first entry)

```
elastin are used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising: inhibiting the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cell in vivo; and regulating the migration of smooth muscle cell in vivo; and regulating the migration of smooth muscle cells in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QFGLVGAAGLGGLGVGGLGVPGVGGLGGIPPAAAAAAAKAAKYGAAGLGGVLGGAGQFPLGGV 144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    by diminished capacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                   Tropoelastin; elastin; elastic fibre; smooth muscle cell proliferation; smooth muscle cell differentiation; smooth muscle cell migration; smooth muscle cell function; atherosclerosis; restenosis; aneurysm; vascular bypass graft stenosis; transplant arteriopathy; dissection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human elastin. compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins inhibiting the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cell in vivo; and regulating the migration of smooth muscle cells in vivo; and regulating the migration of smooth muscle cells in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized by diminished appacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                652

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a fusion protein, comprising human elastin and c-myc, preceded by a His tag. The protein is used in compositions of the invention. The specification describes elastin based

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antiparkinsonian, antiasthmatic and

```
gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypoptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal composition of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating specification, a method for identifying a compound useful in treating continuous and a pharmaceutical composition comprising the one or more polynpeptides or their antibodies. The polynucleotide or the compound that compliant (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNUS) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed form in its inferior in the compound that compound that compound that compound that the compound that the sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              781

                                                                                                                                                                 New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    42
                                                                                                                                                                                                                                                           The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical;

The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycen (GAG))-binding properties. Cells contending vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiwrinkle or hand lotions, also as surgical implants, foods and industrial produces. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated tropoelastin derivative SHEL31-36 New derivatives of human tropoelastin - with elastin-like or macromolecular binding properties, useful e.g. as surgical implants. New derivatives of human tropoelastin Claim 23; Page 10; 82pp; English (UNSY) UNIV SYDNEY WPI; 1999-132162/11

Nucleic acids encoding secretory proteins/membrane proteins, useful in gene therapy or as candidate target molecules in drug development. Nucleic

Claim 1; SEQ ID NO 212; 609pp + Sequence Listing; English.

which encode human secretory or membrane proteins represented by AABB8317

- AAB88419. Included in the invention are primers AAF93317 - AAF94295 and
AAF62232 - AAF6235 which are used to isolate the CDNA sequences of the
invention. The invention also includes methods for the production of
antibodies directed against the proteins, and cDNA sequences, which can
be used in vaccines. The polymucleotide sequences can be used in gene
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The polymucleotide sequences and the protein expression. The
cused in the prevention, treatment and diagnosis of diseases associated
therapy. The polymucleotide sequences may also be used as DNA probes
in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect
cull diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect
cull diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect
cull diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect
cull diagnostic assays (e.g. polymersesion and function of antibodies
cull diagnostic assays (e.g. polymersesion and their role in metabolism. The
polypeptides may be used as antigens in the production of antibodies
capainst them and in assays to identify modulactors (agonists and
antibodies may also be used as therapeutic agents to down regulate expression and
cattivity. The antibodies may also be used as diagnostic agents for
activity. The antibodies may also be used as diagnostic agents for
cefting the presence of the polypeptides in samples (e.g. by enzyme
cull immunosorbant assay (ELISA). Examples of diseases which may be
considered include rheumatoid arthritis and diabetes 62 PLKP-VPGGLAGA-----GLGAGLGALGGVGIPGGVVGAGPAAAAAAAAAKYG 110 74 80 - AAF93916 28; Indels 128; 25 PSSPRVPGALAAAKAAKYGAAVPGVLGGLGALGGVGIPGGVVGAGPAAA-Length 472; This invention relates to nucleic acid sequences AAF93744 32.1%; Score 280; DB 4; 34.7%; Pred.
